

## Greenhouse Gas Emissions in 2024

GAC's direct (Scope 1) greenhouse gas emissions are associated with the use of diesel for vehicles, plant, equipment and electrical generation. Scope 1 emissions measured 72,925 tCO<sub>2</sub>-eq for the year 2024.

We are not connected to the national electricity grid, nor do we contribute to any Scope 2 emissions.

Indirect, Scope 3 emissions are generated from rail transport of ore between the Mine and Port, and business air travel. Emissions from business travel may arise from: • Air travel • Rail travel • Bus travel • Automobile travel (e.g., business travel in rental cars or employee-owned vehicles other than employee commuting to and from work) • Other modes of travel. Scope 3 emissions for the year 2024, measured 4,923,227 tCO<sub>2</sub>-eq.
